Prototype Document

       After a long conversation we decided to choose PUG as our front end framework and Node for our back end framework. We decided to go with PUG for our front end because it is an easily digestible way to output the html needed for this stage of the project. As our project gets more complex and we add more layers to the execution we may branch to a more advanced framework like React.js or Vue.js.

       For our back end framework we used Node and Express because it is from our understanding the closest framework to the industry standard. It is easy to use and implement and has a plethora of documentation to help us fix and bugs we run into. Also the members of our team who have had backend experience before have all used node and express in previous projects so we felt that the learning curve would not be as steep as with other choices.
